PHASE 2 MODULE 7

THE REBUILDR PROGRAMMING SYSTEM: A WHOLE-SYSTEM, CAPACITY-DRIVEN APPROACH TO LONG-TERM, MODERN REHAB.

Rebuildr

THE PURPOSE OF THIS MODULE

By the end of this module, you'll know how to:

- Build structured, whole-system programs
- Address ALL major system gaps within ONE program
- Replace "correctives" with integrated, loaded movement
- Progress clients through the 3-Block Rebuildr Sequence
- Integrate mobility, stability, strength & conditioning cohesively
- Reduce fear avoidance + rebuild training confidence
- Personalize programs without overwhelm
- Deliver modern rehab that creates long-term resilience

SECTION 1:
THE REBUILDR PROGRAMMING PHILOSOPHY

PROGRAMMING IS THE TREATMENT

Traditional rehab treats in the clinic.

Rebuildr rebuilds in the training.

Programming is where:

- adaptation happens
- resilience is built
- confidence returns
- load tolerance expands
- symptoms reduce

We don’t rebuild people in one-hour appointments.
We rebuild them in the hours between them.

WHY MANY HOME EXERCISE PROGRAMS (HEP) FAIL CLIENTS

Because they rely on:

- isolated “correctives”
- low-volume/load
- no fatigue exposure
- little progression
- little movement variability
- little integration into actual training

Clients don’t get injured because of a single area of the body.
They get injured because their system can’t handle the load.

SECTION 2:
THE SYSTEM PATTERNS

PREDICTABLE PATTERNS → PREDICTABLE PAIN

Many active adults share the same system gaps:

- Poor foot control
- Limited hip stability
- Poor frontal plane strength
- Poor ability to control/load rotational patterns
- Poor deep core control
- Underloaded / stiff mid-back
- Poor overhead mobility
- Low capacity under fatigue

THE SYSTEM GAPS ARE PREDICTABLE — SO OUR PROGRAM IS TOO

If many active adults share the same system gaps...
why wait to find them?

We assume they ALL exist — because they almost always do.

So we build one system that improves:

- rotation
- stability
- mobility
- end-range control
- deep core
- fatigue tolerance
- multi-planar capacity

This is why Rebuildr works for ANY client — we rebuild the entire human system.

SECTION 3:
WHY WE PROGRAM THE WAY WE DO

HOW WE ADDRESS EVERY GAP WITHOUT OVERLOADING THE PROGRAM

We don’t give clients 27 exercises.

We solve multiple problems with ONE movement by using:

- Loaded end-range strength → strength + mobility
- Unilateral strength → strength + stability
- Multi-planar drills → rotation + lateral system
- Conditioning → fatigue resilience + cardiovascular capacity
- Vertical upper pull strength → OH mobility + strength

This is whole-system programming — done efficiently.

HOW WE TRAIN CORE: TEACH → INTEGRATE

CORE IS A SKILL

Before core can be integrated into lifts, it must be **taught**.
Clients need to learn:

- how to create tension
- how to manage pressure
- how to resist movement
- how to maintain trunk position under load

Core is a coordination system, not an isolated muscle.

HOW WE TRAIN CORE: TEACH → INTEGRATE

BLOCK 1 — TEACH

In Block 1 we focus on building the foundational skill of core control.
We teach:

- deep core activation
- trunk control
- positional awareness
- breathing + bracing strategies

Goal:
Help clients understand how to use their core before integrating it into full-body lifts.

HOW WE TRAIN CORE: TEACH → INTEGRATE

BLOCK 2 — INTEGRATE INTO EVERY LIFT

Once the client knows how to use their core, it becomes integrated into:

- every compound lift
- every plane of movement
- every stability demand
- every load increase
- every range progression

The core is no longer trained in isolation — it is expressed through the entire system

HOW WE TRAIN CORE: TEACH → INTEGRATE

BLOCK 3 — CORE UNDER SPEED, LOAD & FATIGUE

By Block 3, core control becomes:

- automatic
- reactive
- dynamic
- resilient under fatigue
- stable under speed & plyometrics

Goal:
A core that performs in real life, not just in drills.

LOADED STRENGTH IS MOBILITY

Traditional rehab focuses on:

- stretching
- passive mobility

But long-term, usable, mobility comes from:

- strength through range
- eccentric loading
- end-range control
- progressive exposure

Loaded mobility creates:

- long-term tissue adaptation
- improved movement options
- safer end-ranges
- more durable mechanics
- reduced stiffness + symptom recurrence

STRENGTH TRAINING IS MOBILITY TRAINING- WHEN YOU MOVE THROUGH RANGE.

LOADED STRENGTH IS MOBILITY

EXAMPLES OF LOADED MOBILITY

- Eccentric step downs → glute/quad length
- RDLs → hamstring length
- Pull-ups → overhead mobility
- Lateral leans → oblique length
- Deep split squats → hip flexor length
- Cossack squats → adductor length
- Curtsy squats → lateral glute length

STRENGTH TRAINING IS MOBILITY TRAINING- WHEN YOU MOVE THROUGH RANGE.

THE TRIPOD FOOT: YOUR BASE FOR EVERY LIFT

Every lift starts from the ground.

We teach the tripod foot:

- Big toe
- Little toe
- Heel

This creates:

- better balance
- better force transfer
- better hip + knee mechanics
- better whole-body stability

Stable foot → stable system.

BAREFOOT TRAINING

THE FOOT DRIVES THE CHAIN

Barefoot =

- better feedback
- better stability
- stronger foot intrinsics
- better transfer up the chain

Stable foot → stable knee → stable hip → stable trunk.
Fix the base and the system organizes itself.

THE SCAPULA & SPINE ARE DESIGNED TO MOVE

NOT STAY STUCK OR LOCKED DOWN

PAIN OFTEN DEVELOPS WHEN MOVEMENT IS RESTRICTED WHERE MOTION IS REQUIRED.

The shoulder complex and spine are not meant to be rigid — they are designed to move, rotate, and adapt under load.

We don't eliminate movement.
We teach control through movement.

We do not ALWAYS use the cues "shoulders back and down" or "neutral spine" when referring to these areas.

Ensure you are also:

- Cueing the shoulder blade to lengthen where appropriate
- Programming spinal MOVEMENT

STABILITY FIRST, STRENGTH SECOND

EARN THE RIGHT TO GO HEAVY

Stability creates the foundation that allows strength to be expressed safely and confidently.
Stability = control of position under demand.
We never chase load before the system is ready.

FOR EXAMPLE:

We don’t push heavy squats unless the client can:

- Control the hip joint unilaterally
- Maintain trunk position under load
- Express strength without compensating

PROGRAMMING IMPLICATIONS

- Unilateral work precedes bilateral max loading
- Tempo and pauses precede intensity
- Range control precedes depth progression
- Confidence precedes volume

TWO-JOINT MUSCLES COORDINATE THE SYSTEM

The primary role of a two-joint muscle is not just to create motion — but to transfer force, control range, and coordinate joints during complex tasks.

They:

- Link adjacent joints together
- Manage load as force travels through the chain
- Absorb and produce force simultaneously

When trained well, movement feels smooth and efficient.
When neglected, compensation appears.

THE COMMON TRAINING BLIND SPOT

Most programs train two-joint muscles as if they only act at one joint.

Common mistakes:

- Hamstrings trained only as hip extensors
- Rectus femoris trained only as a knee extensor
- Calves trained only at the ankle
- Biceps trained only as elbow flexors

This creates strength at one joint... but exposes weakness at the other.

This mismatch can lead to poor force distribution and compensation under load or fatigue → higher risk of pain/injury.

THE COMMON TRAINING BLIND SPOT

Common two-joint muscles:

- Hamstrings → hip extension + knee flexion
- Rectus femoris → hip flexion + knee extension
- Gastrocnemius → ankle plantarflexion + knee flexion
- Biceps brachii → shoulder flexion + elbow flexion
- Triceps brachii (long head) → shoulder extension + elbow extension

Rebuildr programming ensures these muscles are:

- Loaded across both joints when trained
- Trained through range
- Integrated into real movement patterns

CONDITIONING IS NON-NEGOTIABLE

Conditioning improves:

- recovery capacity
- motor control under fatigue
- tissue resilience
- cardiovascular health
- load tolerance
- mental clarity

Strength without conditioning is incomplete rehab.

Conditioning is part of the system
— not a bolt-on.

SECTION 4:
THE REBUILDR 3-BLOCK SYSTEM

THE 3-BLOCK REBUILDR SEQUENCE

A predictable progression that builds resilient humans:

Block 1: Foundations [“RESET”]
Build movement quality, positional control, baseline capacity, and tissue tolerance.

Block 2: Strength Integration [“REBUILD”]
Reintroduce load, increase range, develop strength in foundational patterns, and layer in low-grade elastic exposure.

Block 3: Performance Capacity [“RISE”]
Develop power, speed, reactivity, and force production/absorption through contrast training and controlled plyometrics

BLOCK 1: “RESET”

Goal:
Restore movement options, rebuild confidence, improve control, and establish foundational strength with minimal irritability.

Split: Push/Pull/Lower/Upper – Combined

Programming Focus:

- Eccentric control
- Multiplanar
- Stability
- Low threat, low irritability
- Aerobic base building

Outcome:
Client is stable, confident, and ready for increased volume and ROM.

<u>BLOCK 1 IS WHERE CLIENTS FEEL “SAFE” AGAIN</u>

BLOCK 1 IS WHERE WE BREAK THE PAIN CYCLE

This is where we break:

- fear avoidance
- protective strategies
- movement anxiety
- low confidence
- belief that training = pain

Why it matters:

This block rebuilds the foundation most people have never built.

Designed to be: **Pain-free**. Predictable. Safe. Success-focused.

BLOCK 2: “REBUILD”

Goal:
Reintroduce load, increase capacity, restore strength patterns, expand ROM, and introduce low-grade plyometrics.

Split: Upper Push/Pull – Lower Push/Push

Programming Focus:

- Slightly more complexity in control drills
- Increase ROM in main lifts
- Introduce tissue elasticity (low-grade plyos)
- Mild fatigue via increased volume
- Controlled anaerobic conditioning
- Increase strength + volume, keep speed low-threat

Outcome:
Client has restored strength patterns, improved tolerance, and readiness for power.

BLOCK 2 IS WHERE CLIENTS FEEL THEMSELVES “BECOMING STRONG AGAIN.”

BLOCK 3: “RISE”

Goal:
Develop power, reactivity, contrast training, and readiness for “real-world” force demands.

Split: Push Upper – Push Lower – Pull Upper – Pull Lower

Programming Focus:

- Contrast training
- Multi-planar force production/absorption
- All systems conditioning
- Maintain speed + power under fatigue

Outcome:
Client produces and absorbs force safely, efficiently, and with confidence — full return to athletic function.

BLOCK 3 IS WHERE CLIENTS MOVE, PERFORM, AND FEEL LIKE ATHLETES AGAIN.

WHAT PROGRESSES ACROSS THE 3 BLOCKS

LOAD → increases progressively
RANGE → increases Block 2 + 3
VOLUME → increases in Blocks 2 + 3
ELASTICITY → introduced in Block 2, advanced in Block 3
POWER → Block 3
SPEED → Block 3
CONDITIONING → intensity increases across blocks

PROGRAMMING TEMPLATE- THE RBEUILDR METHOD

Regardless of block, every day follows a consistent flow:

Prep

- CNS Regulation / Prime
- Mobility
- Elastic exposure (Block 2–3 only)

A-Series

- Primary strength or contrast supersets (block dependent)

B-Series

- Unilateral + frontal plane + stability

C-Series

- Volume, accessory, or power (block dependent)

D-Series

- Conditioning (block-dependent intensity)

This ensures consistency for the clinician and clarity for the client.

SECTION 6:
PERSONALIZATION

TEMPLATE STRUCTURE, PERSONALIZED INPUTS

You personalize through:

- volume
- load
- exercise selection
- range

The system stays the same —
the expression is individualized.

MODULE SUMMARY

You learned the complete Rebuildr programming system — a clear, structured method to progress any client from pain to performance. We covered how to design programs through three phases:

RESET — restore movement options, reduce threat, and build foundational control.
REBUILD — reintroduce load, expand ROM, and build strength and tissue capacity.
RISE — layer in power, speed, reactivity, and athletic qualities through contrast training and controlled plyometrics.

This is modern rehab.
This is the Rebuildr Method.
